Base Product
P1 Remediation Sprint

Implementation plan and release gates
30 July 2026

P1 FINDINGS **3 REPORT BLOCKERS**	**LOCAL IMPLEMENTATION** **COMPLETE**	**PILOT RELEASE** **DEPLOYED RETEST PENDING**

Executive sprint contract

Close every P1 blocker in the 30 July Base Pilot report without enabling Full Suite order, market-run, or production capabilities.

Exit rule

- Quality save creates both the reusable quality and initial snapshot, or leaves neither record.
- Start From creates a new template and costing-group identity that cannot mutate the source.
- Base captures customer and positive quantity inline, persists both, and exports both.

Local tests are necessary but not sufficient. Final closure requires deployed UI, PDF, and tenant-data evidence.

Sprint board

ID	Workstream	Estimate	Status
P1-QUALITY	Quality-save validation and rollback integrity	0.75 day	Implemented locally
P1-COPY	Independent Start From identity	0.5 day	Implemented locally
P1-CONTEXT	Base customer and quantity workflow	1.0 day	Implemented locally
P1-ARTIFACT	Saved Costings and PDF reconciliation	0.5 day	Implemented locally
P1-RETEST	Deployed workflow and database proof	1.25 days	Pending deployment

Product boundary

BASE GAINS	BASE RETAINS	BASE DOES NOT GAIN
Customer and quantity context	**Costing record semantics**	**Production conversion**

Four-day execution plan

Day 1 - Quality-save integrity

- Do not require hidden tape length for Base quality or costing validation.
- Validate the complete initial snapshot before inserting the template.
- On unexpected snapshot failure, delete the exact tenant template and verify the returned identity.
- Preserve deterministic initial-snapshot idempotency.

ACCEPTANCE - Valid Base recipe with tape length 0 succeeds; invalid input writes zero records; downstream failure leaves no active template.

Day 2 - Independent duplication

- Keep the copied recipe values in memory.
- Detach template, source quote, source timestamp, record kind, and request ID before Start From.
- Save through the new-quality path.
- Verify the copy begins at its own template ID, costing group, and version 1.

ACCEPTANCE - Updating or deleting the copy does not alter the source, and later copy versions stay in the copy group.

Day 3 - Base commercial context

- Load recent tenant-scoped customer names for inline selection.
- Allow a recent customer or a new free-text customer.
- Show and require a positive Base costing quantity.
- Persist customer, order_quantity_m, and meters from the same state.
- Carry populated context into a new quality's initial snapshot.

ACCEPTANCE - A Base owner saves and reopens an explicit customer and 5,000m exactly.

Day 4 - Artifacts and release gate

- Prefill Base customer in exports and Saved Costings.
- Customer PDF shows customer, quantity, unit price, and quotation value.
- Internal PDF shows quantity, margin, and expected total profit.
- Run focused/full tests, lint, production build, audit, deployment, and data reconciliation.

ACCEPTANCE - UI, database, internal PDF, and customer PDF agree, and Base remains unable to create production records.

Acceptance ledger

Gate	Required proof	Blocker condition
QUALITY-01	Base recipe saves without tape length.	Hidden tape validation rejects save.
QUALITY-02	Snapshot validation precedes template insert.	Invalid snapshot leaves a template.
QUALITY-03	Failed snapshot returns exact rollback identity.	Partial template survives.
COPY-01	Start From clears all source identities.	Copy retains source identity.
COPY-02	Copy has distinct template and costing group.	Copy becomes next source version.
PARTY-01	Recent-party chooser plus free text is visible.	Customer exists only in export.
PARTY-02	Explicit customer is required and persisted.	Quality is silently used as party.
QTY-01	Positive Base quantity is visible and required.	Saved row remains 0m.
QTY-02	Reopen restores exact saved quantity.	Quantity is lost.
PDF-01	Customer PDF shows customer, qty, price, total.	Context or total missing.
PDF-02	Internal PDF shows qty, margin, total profit.	Financial context conflicts.
BOUNDARY-01	Base production capabilities remain false.	Full Suite capability leaks.

Local verification evidence

Gate	Result
Focused P1 regression	5 files; 42 tests passed
Full Vitest suite	116 files; 783 passed; 1 intentionally skipped
Changed-file lint	Passed
Full lint	Passed
Production build	Next.js 16.2.12 Webpack/PWA, TypeScript, and 45 static pages passed
Production audit	0 vulnerabilities

Implementation map

Area	Primary implementation
Base capability boundary	lib/costing-workspace.ts
Quality, rollback, parties, persistence	owner/estimator/actions.ts
Initial party data	owner/estimator/page.tsx
Party, quantity, copy, export UI	owner/estimator/EstimatorClient.tsx
Saved Costings context	owner/quotes/QuotesClient.tsx
Regression coverage	Base P1, costing workspace, estimator readiness tests

Risks and controls

- Base keeps costing record_kind and cannot convert to orders or production.
- Legacy 0m or party-equals-quality snapshots remain immutable history; new versions carry explicit context.
- Complete validation runs before the first write; exact compensating cleanup covers unexpected snapshot failures.
- Existing bad copies are not rewritten; deployed proof must create a fresh independent copy.
- Unrelated QA artifacts remain outside the sprint scope.

Definition of done

- All local gates pass and the exact tested revision is deployed.
- Fresh Base save produces one quality and one initial snapshot without hidden tape input.
- Start From produces a different template and costing group at version 1.
- A 5,000m customer costing reopens with exact context.
- Internal and customer PDFs agree with UI and database.
- No Full Suite production capability is exposed to Base.

RELEASE POSITION
P1 is code-complete locally. Pilot closure remains conditional on deployed workflow, PDF, and tenant-data reconciliation.
